

Thirsty? Turn on your tap!

You now have Safe, Clean Drinking Water

After two years of continuous construction, and over 22 km of upgrades to date to the City's water transmission and distribution mains, the new Loch Lomond Drinking Water Treatment Facility is now delivering Safe, Clean Drinking Water to Saint John Water customers east of the Reversing Falls Bridge.

The delivery of newly treated water marks another significant milestone of the City's \$216.8-million Safe, Clean, Drinking Water Project.

About your new water

The quality of the water is significantly improved as it is now treated to a much higher standard. As a result, you should notice improvements to its colour and taste. If you have any concerns about discolouration to your water or major changes to your water pressure, please call Saint John Water.

The new facility has undergone extensive testing and the current transition period includes increased water sampling and monitoring. This monitoring is being done in close collaboration with the Provincial Departments of Health and Environment and Local Government.

Saint John Water will continue to update customers with information and notifications related to the Safe, Clean Drinking Water Project. This will include traffic advisories and ongoing construction.

Questions? Contact 658-4455 or visit saintjohn.ca/eastsidewater for more information.
